For example, in algebraic number theory, one often does Galois theory using number fields, finite fields or local fields as the base field. It allows one to more easily study infinite extensions. Again this is important in algebraic number theory, where for example one often discusses the absolute Galois group of \mathbb{Q} , defined to be the Galois group of \bar{K}/\mathbb{Q} where \bar{K} is an algebraic closure of \mathbb{Q} .
