Methods from stable homotopy theory give an upper bound on the tale index that depends on the period of and the tale cohomological dimension of U ; this bound is expressed in terms of the exponents of the stable homotopy groups of spheres and the exponents of the stable homotopy groups of $B\mathbb{Z}/(p^r)$.

[big picture - What is a cohomology theory \(seriously ...](#)

What is a cohomology theory (seriously)? Ask Question 49, 51. This question has bugged me for a long time. Is there a unifying concept behind everything that is called a "cohomology theory"? I know that there exist generalized cohomology theories, Weil cohomology theories and perhaps one might include delta-functors, which describe (some of) the properties of explicit cohomology theories. But

The most modern and thorough treatment of unstable homotopy theory available. The focus is on those methods from algebraic topology which are needed in the presentation of results, proven by Cohen, Moore, and the author, on the exponents of homotopy groups.

Galois cohomological objects given by homotopy xed point constructions, but only up to pro-equivalence. The homotopy xed point spaces de ne nite Galois descent for spaces, and a pro-categorical construction is a necessary second step for passage from nite descent conditions to full homotopy theoretic descent in a Galois cohomological setting. Introduction Descent theory is a large subject
