Conclusions. Sex differences exist in skeletal muscle gene transcription both at rest and following acute RE, suggesting that sex is a significant modifier of the transcriptional regulation in skeletal muscle.

[Gene expression in skeletal muscle - ScienceDirect](#)

This chapter explores gene expression in skeletal muscle.

It describes the major stages in muscle development.

Skeletal muscle develops from the embryonic mesoderm. The precursor cells giving rise to the myogenic lineage are also thought to be the source of fibroblast and chondrocyte lineages. These mesodermal cells are arranged as somites around the central cavity of the early embryo and

First, several used animal models (2, 12), and there are likely species-specific differences in gene expression during recovery from muscle damage. Second, in the human studies (11 , 30 , 62), only time points within the first 24 h were assessed, and gene changes during the second wave of damage were not captured.

[Gene expression - Wikipedia](#)

Gene expression is the process by which information from a gene is used in the synthesis of a functional gene product. These products are often proteins, but in non-protein-coding genes such as transfer RNA (tRNA) or small nuclear RNA (snRNA) genes, the product is a functional RNA.

This skeletal muscle compendium is publicly available to allow further studies on gene expression in skeletal muscle. In the current analysis, we present a detailed description of age-related differences in gene expression in human skeletal muscle and identify 957 genes significantly associated with age.
