In functional analysis, an operator algebra is an algebra of continuous linear operators on a topological vector space with the multiplication given by the composition of mappings. The results obtained in the study of operator algebras are phrased in algebraic terms, while the techniques used are highly analytic. [1]

Abstract. In this paper, we will describe the general form of commuting mappings of Hochschild extension algebras and characterize the properness of commuting mappings on a special class of Hochschild extension algebras with the so-called p .

A von Neumann algebra A is a weakly closed, self-adjoint algebra of operators on a Hilbert space H containing the identity operator I . A is a factor von Neumann algebra means that its center only contains the scalar operators. It is well known that the factor von Neumann algebra A is prime, in the sense that $AAB = 0$ for $A, B \in A$ implies either $A = 0$ or $B = 0$. Our main result reads as follows:
