[Metastability - Wikipedia](#)

In physics, metastability is a stable state of a dynamical system other than the system's state of least energy. A ball resting in a hollow on a slope is a simple example of metastability.

[What Is Metastability? - asic-world.com](#)

This page contains tidbits on writing FSM in verilog, difference between blocking and non blocking assignments in verilog, difference between wire and reg, metastability, cross frequency domain interfacing, all about resets, FIFO depth calculation, Typical Verification Flow Digital Logic metaStability and Flip Flop MTBF Calculation

The Table above shows various Set-Up times and Hold times for a number different Logic families. The combination of the two values determine the width of the metastability window.

[Flip-flop \(electronics\) - Wikipedia](#)

In electronics, a flip-flop or latch is a circuit that has two stable states and can be used to store state information. A flip-flop is a bistable multivibrator.

[Synchronous & Asynchronous Reset VLSI Pro](#)

Reset Reset is a signal that is used to initialize the hardware, as the design does not have a way to do self initialization. That means, reset forces the design to a known state. In simulation, usually it is activated at the beginning, but in real hardware, reset is usually activated to power up the []

Quantum Theory of Collective Phenomena (Dover Books on ...

This systematic approach to the quantum theory of collective phenomena is based principally on the model of infinite systems. Suitable for advanced undergraduates and graduate students of physics and chemistry, the three-part treatment begins with an exposition of the generalized form of quantum theory of both finite and infinite systems.
