Mineral homeostasis can also be influenced by cytokines and other inflammatory mediators (see Chapter 3). As bone is negatively affected by chronic inadequate intake of dietary calcium or phosphate and by inherited or acquired defects in calcium or phosphate homeostasis, one might reasonably conclude that the regulation of calcium and phosphorus homeostasis is designed to maintain bone integrity.

[Phosphate homeostasis and its role in bone health](#)

Body phosphate homeostasis is determined by modulation of intestinal uptake of dietary phosphate. Studies in both humans and mice have demonstrated that the preservation of normal mineral ion homeostasis can compensate for the absence of 1,25(OH)₂D₃ or functional vitamin D receptors, resulting in a normal growth plate phenotype. These studies raised the question as to whether

Stimulating net resorption of bone mineral releases calcium and phosphate into blood, and suppressing this effect allows calcium to be deposited in bone. The kidney

is critically important in calcium homeostasis. Under normal blood calcium concentrations, almost all of the calcium that enters glomerular filtrate is reabsorbed from the tubular system back into blood, which preserves blood
