[T helper cell - Wikipedia](#)

The T helper cells (T<sub>h</sub> cells) are a type of T cell that play an important role in the immune system, particularly in the adaptive immune system. They help the activity of other immune cells by releasing T cell cytokines. These cells help suppress or regulate immune responses. They are essential in B cell antibody class switching, in the activation and growth of cytotoxic T cells, and in

[T follicular helper cell differentiation, function, and ...](#)

Follicular helper T (T<sub>fh</sub>) cells are specialized providers of T cell help to B cells, and are essential for germinal center formation, affinity maturation, and the development of

most high affinity antibodies and memory B cells. T<sub>H</sub> cell differentiation is a multi-stage, multi-factorial process.

#### Differentiation of Effector CD4 T Cell Populations

These events occur mainly within germinal centers, and the CD4 T cells that enter the germinal center to mediate their helper function for antibody production are often designated T follicular helper (T<sub>fh</sub>) cells.

#### T Helper Cell Differentiation, Heterogeneity, and Plasticity

It is also possible that activated T cells may acquire IFN- $\gamma$  or IL-4-producing capacity and a T<sub>H</sub> phenotype simultaneously, and thus their fate to become either conventional Th1/Th2 effector cells or specific cytokine-producing T<sub>H</sub> cells may have been determined at very early stages of T-cell differentiation (Nakayamada et al. 2011; Johnston et al. 2012; Oestreich et al. 2012).

#### T cell | cytology | Britannica.com

Once stimulated by the appropriate antigen, helper T cells secrete chemical messengers called cytokines, which stimulate the differentiation of B cells into plasma cells (antibody-producing cells). Regulatory T cells act to control immune reactions, hence their name. Cytotoxic T cells, which are activated by various cytokines, bind to and kill infected cells and
